DEPLOYING A ZOHO CREATOR APPLICATION FROM DEVELOPMENT TO PRODUCTION ENVIRONMENT

AIM

To deploy a Zoho Creator application from the Development environment to the Production environment so that the application can be accessed and used in the live environment.

PROCEDURE

1. Log in to Zoho Creator using your account credentials.

2. Open the application that you want to deploy in the Development environment.

3. Review the application before deployment. Check that the forms, reports, pages, workflows, and other required components are configured correctly.

4. Test the application in the Development environment. Submit sample records, open reports, and verify that workflows behave as expected.

5. Open the deployment or environment management option for the application. The exact label and location may vary depending on the Zoho Creator interface and account permissions.

6. Choose the option to deploy or publish the application to the Production environment.

7. Review the deployment details and confirm that the required application components and settings are included.

8. Confirm the deployment when prompted and wait for Zoho Creator to complete the process.

9. Open the Production environment and check that the deployed application is available.

10. Test the production application by submitting a sample form record and checking the related reports and workflows.

11. Verify user permissions and ensure that any required connections or integrations are configured appropriately for the Production environment.

12. If any issue is found, review the configuration and correct it according to the available deployment and environment options.

RESULT

The Zoho Creator application was deployed from the Development environment to the Production environment, and the deployed application was checked to verify that its main features were functioning correctly.
